

Hardware Pre-Install Solutions

WHAT IS PRE-INSTALLATION?

Preinstallation is the process by which Architectural Concepts factory certified door technicians install hinges, closers, locksets, exit devices, and electrified hardware components on primed or prefinished doors in a state of the art, controlled environment before delivery to the jobsite.

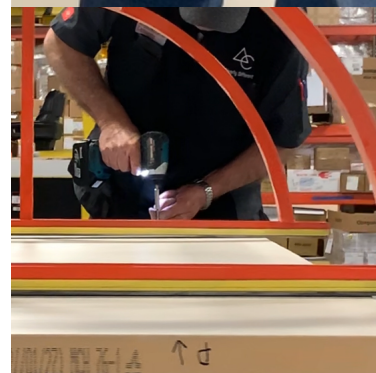

Reduces time on site by up to 75%

Doors can be hung in less than 10 min

WHAT ARE THE BENEFITS OF PRE-INSTALLATION?

- Doors are delivered labeled and palletized by location and ready to be hung.
- Reduces time on site by up to 75%.
- Allows for doors to be installed later in the construction cycle via compressed schedule reducing opportunity for damage and after completion of other finish trades.
- Doors can be hung in less than 10 min per door, saving time and money.
- Reduces the need for expertise in the field, allowing for more efficient resource allocation.
- Problems are identified and corrected before they ever hit the jobsite. Incorrect door, incorrect hardware preps, missing parts, defective product, improperly sized hardware.
- Hardware isn't lost, damaged or stolen on site reducing unnecessary change order costs.
- Less packaging and waste to be thrown away on the jobsite. Architectural Concepts is committed to the environment and employs an aggressive recycling protocol.
- Electrified hardware is tested and certified before it arrives on the jobsite.
- Shorter punch lists with reduced damage and field touch ups. Doors go in later, after flooring and FFE are put in the rooms.
- All other non-door-mounted hardware components, (silencers, wall stops, smoke seals) are bagged and shrink wrapped to each door. No need for inventorying or relocating hardware on site.
